# KEY URECON CHIP-100

## High School Locker Room Case Study

**Before**

**After**

The KEY URECON Chip-100, a urethane-modified cementitious floor system finished with a decorative broadcast flake, provides many advantages to designers and contractors over a standard epoxy chip floor.

This restoration project required installation over existing ceramic tile and “green concrete” trench repairs. The moisture tolerant nature of the URECON allowed for an accelerated installation of a seamless floor.
